

The Relative Academic Achievement of International Students: Evidence from an Ontario University

Jong Jia Chen and Mikal Skuterud

Department of Economics
University of Waterloo

St. Mary's University, Halifax, Nova Scotia

~~February 7, 2020~~

~~March 27, 2020~~

July 9, 2020

Background

- Growing international student share of Canadian university enrolments (4.1% in 1992/93 to 8.2% in 2009/10 to 15.7% in 2018/19 and expected to be close to 17% in 2019/20).
- Shifting preference for former international students in immigrant selection policy (8.1% of new PRs in 2007 to 12.4% in 2016, IMDB).
- Disparities in labour market outcomes relative to domestic counterparts graduating from similar academic programs (Hou and Lu 2017; Chen and Skuterud 2018).
 - Evident in earnings, employment rates, occupations, and likelihood jobs match educational field and level of study
 - Some evidence that disparities growing over time

Research questions

→ What explains labour market challenges of former international students?

- Relative labour market skills and abilities (e.g., language)
- Labour market inefficiencies (e.g., discrimination and job search frictions, but not credential recognition)

University course grades: (i) predict starting salaries (Jones and Jackson 1990; Chia and Miller 2008); and (ii) are less likely to reflect discrimination than labour market outcomes.

→ What is the relative academic performance of international students?

→ Has relative performance changed over time as their share of enrolments has increased?

Research questions

- What explains labour market challenges of former international students?
 - Relative labour market skills and abilities (e.g., language)
 - Labour market inefficiencies (e.g., discrimination and job search frictions, but not credential recognition)

University course grades: (i) predict starting salaries (Jones and Jackson 1990; Chia and Miller 2008); and (ii) are less likely to reflect discrimination than labour market outcomes.

- What is the relative academic performance of international students?
- Has relative performance changed over time as their share of enrolments has increased?

Data

- Publicly-funded university located in Ontario with a large and growing international student presence
- All undergraduate course grades of 2004-2015 entry cohorts
- Four faculty groups:
 - A & B: technology, engineering, and mathematics
 - C: arts, humanities, business, and social sciences
 - D: sciences
- Distinguish international students with foreign and Canadian high school diplomas (FEIS vs. CEIS)
- Sample sizes: 439,338 (A); 551,844 (B); 536,560 (C); 715,701 (D)

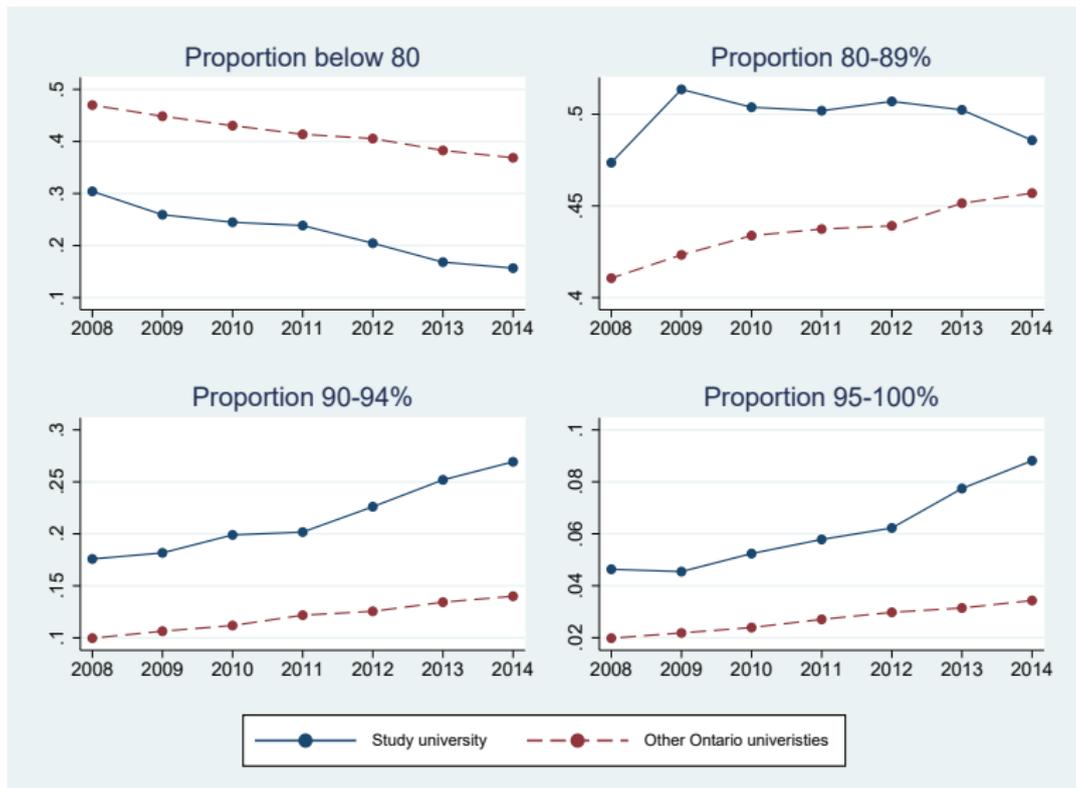

International student enrolment shares

Foreign student country of citizenship

Entering average grades of applicants

Theory

Student quality in foreign (f) and domestic (d) populations:

$$q_j \sim N(\mu_j^q, \sigma_j^q) \text{ for } j = \{f, d\}.$$

University attracts foreign and domestic applicants with probability π_j in population n_j .

Uses high school entry grades e_j to signal student quality:

$$e_j = q_j + u_j, \text{ where } u_j \sim N(\mu_j^u, \sigma_j^u).$$

Pools applicants and sets \underline{e} as a function capacity c , as well as n_j and π_j .

Relative quality of applicant pool

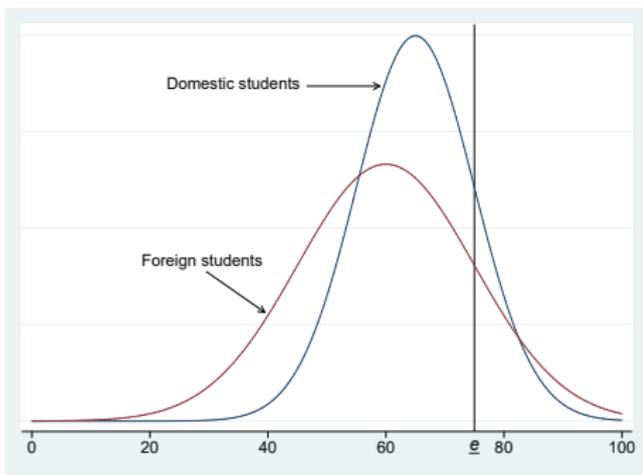

Assuming entry grades identify student quality perfectly ($q_j = e_j$), the mean quality of admitted foreign and domestic students is:

$$E(e_j | e_j > \underline{e}) = \mu_j^q + \sigma_j^q \left[\frac{\phi(\mu_j^q, \sigma_j^q; \underline{e})}{1 - \Phi(\mu_j^q, \sigma_j^q; \underline{e})} \right].$$

$\mu_f < \mu_d, \sigma_f > \sigma_d$:

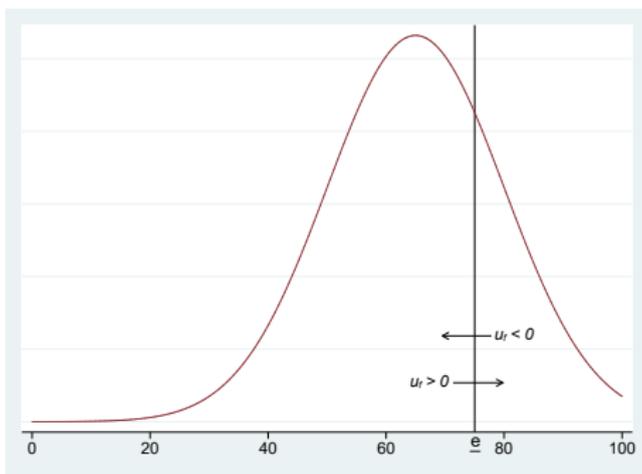

If σ difference large relative to μ difference, mean quality of foreign students higher.

Difference larger at upper end of distribution.

Entry grades as imperfect quality signal

Foreign student entry grades are measured with mean-zero error ($e_f = q_f + u_f$ and $\mu_f^u = 0, \sigma_f^u > 0$).

Noisy entry grades reduce mean quality of admitted students.
Difference largest at bottom end of distribution.

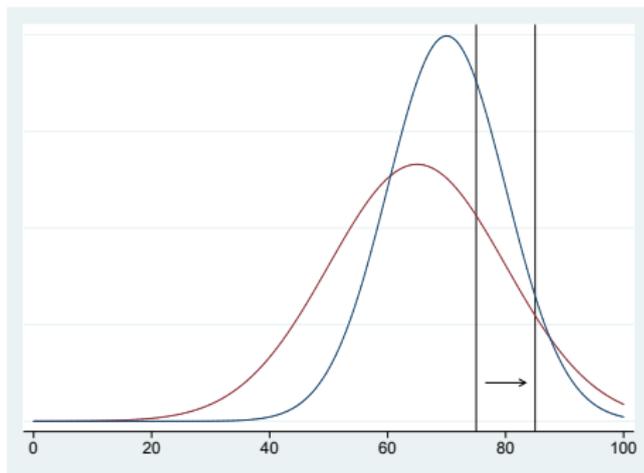

Increase in foreign student applications

Foreign recruitment produces a distribution-preserving increase in foreign applications. Without an equivalent increase in capacity, \underline{e} increases.

$$\frac{dE(e_j | e_j > \underline{e})}{d\underline{e}} = \lambda(\alpha_j) [\lambda(\alpha_j) - \alpha_j] > 0$$

which is increasing in:

$$\alpha_j = (\underline{e} - \mu_j) / \sigma_j.$$

Relative gains in academic performance should be largest at the top end of the grade distribution.

Empirical specification

1. Estimate two-way fixed effects model

$$\underbrace{g_{ijt}}_{\text{course grade}} = \underbrace{\theta_i}_{\text{student FEs}} + \underbrace{\alpha_j}_{\text{course-instructor FEs}} + \underbrace{\sum_a \gamma_a d_{it}^a}_{\text{terms since enrollment FEs}} + \underbrace{\varepsilon_{ijt}}_{\text{error}}$$

2. Relative fixed effects of foreign students

$$\underbrace{\hat{\theta}_i}_{\text{student FEs}} = \underbrace{\sum_c \pi_c d_i^c}_{\text{entry cohort FEs}} + \underbrace{f_i (\lambda^f + \pi^f c_i)}_{\text{relative foreign student quality}} + \underbrace{\mu_{ijt}}_{\text{error}}$$

3. Predictive error of entry grades

$$\underbrace{\hat{u}_i}_{\text{noise}} = \underbrace{e_i}_{\text{entry grade}} - \underbrace{\hat{\theta}_i}_{\text{student FEs}}$$

Relative fixed effects of foreign students

Proportion of applications receiving admission offers

Distribution of error in entry grades

Other findings

- Disparities in foreign student grades:
 - appear related to English language ability (mandatory language training enrolment and linguistic distance)
 - tend to be larger in upper- than first-year courses
 - not smaller in program-required than elective courses
- Mean error in entry grades increasing across domestic, but not foreign, entry cohorts (convergence).

Other findings

- Disparities in foreign student grades:
 - appear related to English language ability (mandatory language training enrolment and linguistic distance)
 - tend to be larger in upper- than first-year courses
 - not smaller in program-required than elective courses

- Mean error in entry grades increasing across domestic, but not foreign, entry cohorts (convergence).

Summary

- We identify gaps in the academic achievement of foreign students, which are remarkably similar in magnitude across fields of study.
- Gaps appear to overwhelmingly reflect the lower grade achievement of international students with Canadian high school diplomas.
- From the university perspective, the challenge appears to be in using high school grades to screen applicants and not in improving the quality of foreign applicants.

Summary

- We identify gaps in the academic achievement of foreign students, which are remarkably similar in magnitude across fields of study.
- Gaps appear to overwhelmingly reflect the lower grade achievement of international students with Canadian high school diplomas.
- From the university perspective, the challenge appears to be in using high school grades to screen applicants and not in improving the quality of foreign applicants.

- Gaps appear to overwhelmingly reflect the lower grade achievement of international students with Canadian high school diplomas.
- From the university perspective, the challenge appears to be in using high school grades to screen applicants and not in improving the quality of foreign applicants.

Policy implications

- Academic challenges of foreign students are consistent with labour market evidence.
- Roughly one-third of international students transition to permanent residency (Lu and Hou 2015).
- How predictive are university grades of their labour market outcomes? What is the grade selectivity of PR transitions? Could postsecondary grades be used as a immigrant screening criterion?

Policy implications

- Academic challenges of foreign students are consistent with labour market evidence.
